# GUJARAT TECHNOLOGICAL UNIVERSITY

B.E. Sem-V<sup>th</sup> Examination December 2010

**Subject code: 150102**

**Subject Name: Fundamentals of Turbo Machines**

**Date: 15 /12 /2010**

**Time: 03.00 pm - 05.30 pm**

**Total Marks: 70**

**Instructions:**

1. Attempt all questions.
2. Make suitable assumptions wherever necessary.
3. Figures to the right indicate full marks.

**Q.1 (a)** Determine the impeller diameters at the width at the impeller exit and the **07** power required to drive the compressor, from the following given data:

Speed 12500 rpm, mass flow 15 kg/s, pressure ratio 4:1, isentropic efficiency 75%, slip factor 0.9, flow coefficient at impeller exit 0.3, hub diameter of eye 15 cm, velocity of air at the entry to and the exit from the impeller 150 m/s, stagnation temperature and stagnation pressure at inlet 295 K and 1 bar. Assume equal pressure ratio in the impeller and diffuser.

**(b)** Define degree of reaction and derive the expression for the same. Define the **07** low reaction stage and high reaction stage.

**Q.2 (a)** Draw and explain the H-S diagram for the axial turbine stage. Also define the **07** performance coefficient for the same.

**(b)** A multistage gas turbine is to be designed with impulse stages, and is to operate with an inlet pressure and temperature of 6 bar and 900 K and at outlet pressure of 1 bar. The isentropic efficiency of the turbine is 85%. All the stages are to have a nozzle outlet angle of 15° and equal outlet ad inlet blade angles. Mean blade speed of 250 m/s and equal inlet and outlet gas velocities. Estimate the number of stages required considering optimum blade to gas speed ratio.

**OR**

**(b)** Draw and explain zero percent, fifty percent and hundred percent reaction **07** axial turbine stages.

**Q.3 (a)** How the radial turbine differs than axial turbine? Show the entry and exit **07** velocity triangle for a general inward flow radial turbine stage.

**(b)** For a ninety percent IFR turbine stage derive the expressions for power, stage **07** loading coefficient and degree of reaction.

**OR**

**Q.3 (a)** How the spouting velocity is to be defined? Derive the expression for the **07** stage efficiency for the radial turbine stage in terms of pressure ratio and loading coefficient.

**(b)** An IFR turbine impulse stage with cantilever blades has a flow coefficient of 0.4 and develops 100 KW with a total to total efficiency of 90% at 12000 rpm. If the flow rate is 2 kg/s at an entry temperature of 400 K determine the rotor diameters, blade angles at the entry and exit, the nozzle exit air angle and the stagnation pressure ratio across the stage. Take  $d_3=0.8d_2$ , zero swirl and constant meridional velocity.

- Q.4** (a) Explain the stalling and surging for an axial compressor stage. **07**  
(b) Air at temperature of 290K enters a ten stage axial flow compressor at the rate of 3kg/s. the pressure ratio is 6.5 and the isentropic efficiency is 90%, the compression process being adiabatic. The compressor has symmetrical blades. The axial velocity of 110 m/s is uniform and the peripheral speed of each stage is 180 m/s. determines the rotor and stator blade angles and flow angles and also the power given to the air. Assume temperature change in each stage is constant.

**OR**

- Q.4** (a) The conditions of air at entry of an axial compressor stage are 768 mm Hg and 314 K. the air angles are  $\beta_1=51^\circ$ ,  $\beta_2= 9^\circ$ ,  $\alpha_1=\alpha_3=7^\circ$ . The mean diameter and peripheral speed are 50 cm and 100 m/s. mass flow rate 25 kg/s, the work done factor 0.95 and mechanical efficiency is 92%. Assuming a stage efficiency 88% determine: air angle at the stator entry, blade height at entry and the hub tip diameter ratio, stage loading coefficient and stage pressure ratio.

- (b) Draw and explain the sketch of two stage axial compressor with IGVs. **07**

- Q.5** (a) Explain the matching procedure for the compressors and turbines. **07**  
(b) What is an equilibrium diagram? How to find out the equilibrium points from the characteristic curves?

**OR**

- Q.5** (a) Classify and explain the turbo machines with respect to flow direction, types of fluid and degree of reaction. **07**  
(b) Derive the dimensionless parameter for compressor pressure  $p_2$ . where  $p_2 = f(p_1, D, m, N, \rho)$  **07**
